

Kratos Continues Leadership in Satellite Ground Segment Modernization with Introduction of Virtual Channelizer and Combiner

November 29, 2022

Virtualized and Orchestrated Products Support the Dynamic Needs of Today's Software-Defined Payloads and Multi-Orbit Constellations

SAN DIEGO, Nov. 29, 2022 (GLOBE NEWSWIRE) -- Kratos Defense & Security Solutions, Inc. (Nasdaq: KTOS), a leading National Security Solutions provider announced today the general availability of its virtual OpenSpace Channelizer and Combiner for satellite ground operations. The products are used to split and combine digitized RF signals for more effective downlink and uplink, especially to support the advanced capabilities of next generation software-defined satellites and LEO constellations. For example, to support increasing customer demand or to address potential cases of interference, a high bandwidth signal from a software-defined satellite can be split into smaller signals and routed across the ground dynamically for service delivery or for RF analysis.

The OpenSpace Channelizer and Combiner are completely virtualized running on general purpose compute, replacing the racks of proprietary RF analog devices such as splitters and dividers that constitute today's ground systems. Analog hardware components are not capable of keeping up with the faster demands growing in the space layer, such as high throughput spot beams, multi-orbit constellations and programmable payloads. For example, it can take days, weeks and sometimes months to make configuration changes to hardware, often requiring technicians to fly to remote locations to re-cable and install hardware in teleports. As software, however, the OpenSpace Channelizer and Combiner enable configuration and reconfiguration in just seconds in order to adapt to changing mission conditions such as interference or to support changing customer service levels.

The OpenSpace Channelizer and Combiner go beyond simple virtualization. They are orchestrated together with any standards-based digitizer and with other OpenSpace Platform ground functions to support automation and the quick provisioning of new services across the ground segment, including needed uplink/downlink functions. Virtual elements can be spun up for new missions on the fly and when no longer needed, spun down so the resources can be used for other operations.

The OpenSpace Channelizer and Combiner support a variety of satellite use cases for applications in two-way satellite communication (SATCOM) services, Earth Observation and Remote Sensing (EO/RS), and Telemetry, Tracking & Command (TT&C). Intelsat, the world's largest commercial satellite operator, will be among the first users of the OpenSpace Channelizer and Combiner for SATCOM. In May of this year Intelsat announced it would use Kratos' OpenSpace Platform to support its coming software-defined satellites and supporting ground network.

"We are supporting our customers growing connectivity needs for high-speed and reliable coverage on a global scale by enabling software-defined capabilities across our network," commented Carmel Ortiz, VP of Systems Innovation at Intelsat. "Working in concert with our dynamic satellites, the OpenSpace Channelizer and Combiner as part of the OpenSpace Platform will help us accelerate the provisioning of new connectivity services and respond to traffic spikes in a matter of seconds."

"The OpenSpace Channelizer and Combiner are available today to support the satellite ground systems movement toward digital transformation," explained Christopher Boyd, Vice President of Product Management at Kratos. "The OpenSpace Platform is a fully digital gateway solution with digitizers that route RF signals from antennas across the ground system using virtualized channelizers/combiners to modem service chains that process the signals. The fully digital and software-based approach enables OpenSpace to be deployed in a single teleport or scaled across multiple teleports and data centers depending on service scale requirements."

About OpenSpace

Kratos' OpenSpace family of solutions enables the digital transformation of satellite ground systems to become a more dynamic and powerful part of the space network. The family consists of three product lines: OpenSpace SpectralNet for converting satellite RF signals to be used in digital environments; OpenSpace quantum products, which are virtual versions of traditional hardware components; and the OpenSpace Platform, the first commercially available, fully orchestrated, software-defined ground system. These three OpenSpace lines enable satellite operators and other service providers to implement digital operations at their own pace and in ways that meet their unique mission goals and business models. For more information about the OpenSpace family visit: <https://www.KratosDefense.com/OpenSpace>.

About Kratos Defense & Security Solutions

Kratos Defense & Security Solutions, Inc. (NASDAQ:KTOS) develops and fields transformative, affordable technology, platforms and systems for United States National Security related customers, allies and commercial enterprises. Kratos is changing the way breakthrough technology for these industries are rapidly brought to market through proven commercial and venture capital backed approaches, including proactive research and streamlined development processes. At Kratos, affordability is a technology and we specialize in unmanned systems, satellite communications, cyber security/warfare, microwave electronics, missile defense, hypersonic systems, training, combat systems and next generation turbo jet and turbo fan engine development. For more information go to www.KratosDefense.com.
